

BlitzHash - AI app launch checklist

Illustrative checks we use before a production launch.

Data security

1. RLS is on for every table the app reads or writes.
How to check: table list and Security Advisor.
2. No policy uses an always-true condition on user data.
How to check: read `pg_policies` and with check clauses.
3. No secret keys in the frontend bundle.
How to check: search built JavaScript for secret prefixes.
4. One user cannot read another user's rows.
How to check: two accounts, plus an anonymous request.

Auth and email

5. Login works on the production domain.
6. Redirect URLs point at production, not localhost.
7. Auth email uses your SMTP and domain.
8. Email confirmation is on for new sign-ups.

Deploy and code

9. Code lives in a GitHub repository you own.
10. Production deploys from that repository.
11. Preview and production env vars are separate.
12. You can roll back in minutes.

Payments, if you take them

13. A real purchase completed on live keys.
14. Webhooks verify signatures and tolerate retries.
15. Provider secret keys stay on the server.

Backups and monitoring

16. The database is backed up automatically.
17. A backup has been restored at least once.
18. Someone is alerted when the app is down.
19. Production errors are visible to you.
